

## **Static Electricity Scientists**

Today we made static electricity using balloons and our hair. First we had a bad hair day by rubbing balloons off our hair and making it stand up.

Next in pairs each child rubbed the balloons off their hair and held their balloons next to each other. The static electricity on the balloons caused them to repel each other.

For our next experiment after rubbing out hair we used the static electricity to move an empty can.

Finally for our last experiment after rubbing our hair we held the balloons over a plate of rice krispies and the children made the rice krispies fly!
